

SYMMON JARED GAGARING

Aspiring Software Engineer | Aspiring Full-Stack Developer

Philippines | 09621204257 | symmonjaredgagaring@gmail.com | linkedin.com/in/symmongagaring | github.com/SyJared

SUMMARY

Recent BS Information Technology graduate with hands-on experience building full-stack web and mobile applications using ASP.NET Core, Spring Boot, React, React Native, Node.js, Express.js, PostgreSQL, and MySQL -- including secure REST APIs, real-time WebSocket services, JWT/API-key authentication, and Docker deployments. Also built a full-stack Retrieval-Augmented Generation (RAG) application from scratch, covering document chunking, vector embeddings, semantic search with pgvector, LLM prompt engineering, structured outputs, and hallucination mitigation. Passionate about backend development and practical software solutions.

TECHNICAL SKILLS

Languages: C#, JavaScript, TypeScript, Python, SQL, Java, PHP

Frontend: React, React Router, React Native, Expo, HTML5, CSS3, Tailwind CSS

Backend: ASP.NET Core Web API, Node.js, Express.js, REST APIs, Spring Boot, WebSockets

Database: PostgreSQL, MySQL, pgvector, Entity Framework Core

Cloud: AWS (EC2, S3, Aurora), Azure (App Service, Container Apps) — foundational

AI / LLM Engineering: RAG Pipelines, LLM APIs (Anthropic Claude, Google Gemini), Prompt Engineering, Vector Embeddings, Semantic Search, Structured Outputs, Hallucination Mitigation

Authentication & Security: JWT Authentication, API Key Authentication, Role-Based Authorization, bcrypt, Zod Validation

Tools & Technologies: Git, GitHub, Docker, Linux (Basic), Tailscale, EAS Build, AI-assisted Development, Postman

Machine Learning: NumPy, Pandas, Scikit-learn

PROJECTS

SymDoc – AI Document Q&A (RAG) System — *React, Node.js, Express, PostgreSQL (pgvector), Voyage AI, Google Gemini*

- Built a full-stack Retrieval-Augmented Generation application that lets users upload documents and ask natural-language questions answered strictly from that content.
- Designed a document ingestion pipeline that chunks text with overlapping windows, generates vector embeddings via the Voyage AI API, and stores them in PostgreSQL using pgvector for semantic search.
- Engineered prompt templates and JSON response schemas to constrain LLM (Gemini) output to a structured answer, confidence level, and cited sources, with optional per-document filtering and multi-turn conversation context.
- Built a hallucination-mitigation layer that programmatically verifies each LLM-cited quote against the retrieved source text, decoupling the model's self-reported confidence from a code-verified grounding signal.

SymMoni – Cross-Platform Laptop Monitoring System — *React Native (Expo), Spring Boot, OSHI, WebSockets, Tailscale*

- Built a full-stack system monitoring application that streams a laptop's live CPU, memory, disk, network, and battery statistics to a companion React Native mobile app over WebSockets, updated every 2 seconds.
- Implemented a process management feature allowing users to view, search, sort, and remotely terminate running processes from the mobile app, with confirmation and feedback.
- Secured REST and WebSocket endpoints with a custom API key authentication filter and handshake interceptor, and exposed the backend remotely and securely via Tailscale.

School Management System — *ASP.NET Core, React, PostgreSQL, Entity Framework Core*

- Developed a full-stack school management system supporting Admin, Teacher, and Student roles with JWT authentication and role-based authorization.
- Built classroom, student, attendance, and grading management modules with RESTful APIs using ASP.NET Core and Entity Framework Core, including attendance editing and class completion workflows.
- Developed separate dashboards and functionality for teachers and students using React and React Router.

Flow – Team Workspace Application — *React, Node.js, Express.js, MySQL, Python*

- Built a collaborative workspace application supporting multiple workspaces and task boards, with JWT-secured authentication and RESTful APIs using middleware validation and bcrypt password hashing.
- Developed a Python recommendation prototype that analyzes historical task completion data to suggest the team member most likely to complete a new task successfully.
- Integrated a generative AI sprint summary feature that automatically summarizes completed work, pending tasks, and sprint progress to improve team reporting.
